

NetLessor Minor Release

2026.0.2.0 - March 12th, 2026

Minor Updates

- When submitting an invoice job that utilized a grouped invoice search, high volume invoices could split into multiple batches. This will now respect the grouping and attempt to batch the invoices together.
- Added a current payment field to the lease record to track the current payment (earliest open period payment) for the lease.
- Added new buyout functionality to the close out suitelet. Allows the user to create a buyout invoice for the lease when closing out the lease. Defaults to the total residual value of the lease or the override value if specified. Item defaults to buy out invoice item found on the lease type, or the default invoicing item if not found.

Bug Fixes

- Fixed an issue where the termination journal would book the net cash twice for prior period terminations.
- Fixed an issue related to how the total boxes are calculated for the report generators.
- Fixed an issue that the renewal options were being displayed in order of the internal ID instead of the date/number.
- Fixed an issue where grouped invoices that had \$0 payments, but had non-lease payments would be sorted as a credit memo disregarding the invoice grouping.
- Allow modification journal for secondary classification changes to be stored on the modification record.
- Improved handling of NetSuite restarts on Map/Reduce jobs on grouped invoices.
- Prevented the Reprocess button from showing on the NetLessor Transaction Processing record if the script has not completed.
- Fixed an issue with true ups on leases with cash basis classification.

- Fixed an issue where the reversal of a journal entry would not correctly update the remaining payment on the lease.
- Fixed an issue where terminating a lease with a non-monthly payment frequency would result in a hard error due to date setting.
- Fixed an issue where the final renewal end date would not update after a renewal option's date was changed and cascaded to subsequent lines.
- The lease classification field is now disabled on Modifications when the lease classification accounting is set to auto calculate or operating only. Previously the field was enabled but would recalculate after the modification was submitted.
