

NetLessor Minor Release

2026.1.5.0 - June 26th, 2026

Minor Updates

- Added a modification link to schedule lines that are updated or created through a modification, for reporting purposes.
- Added support for suitelet-driven custom sourcing fields. Users can now configure a custom sourcing rule to display a manual input field on a processing suitelet (Commence, Classification, Create Lease, etc.), where the entered value is written directly to the target field on the resulting lease or transaction — without requiring a source field on the originating record.
- Added support for automated, scheduled processing of custom reclass journal entries via the Automate Jobs functionality. A new script parameter allows a Reclass Journal Type to be specified on the deployment, replicating the manual Reclass Suitelet flow on a configured schedule.
- Added a "Run Up To and Including" setting on the NetLessor Automate Jobs page, allowing users to run reclasses up to and including the current period.
- Fixed an issue where payments following a mid-month renewal were not prorated when prorated payments were enabled.
- Added the ability to hide the "Buy Out" button on leases if the global setting "Buy Out Button" is disabled.
- Added the ability to group adhoc invoices.

Bug Fixes

- Fixed an issue where, when viewing a modification proposal, the labels would incorrectly default the term unit based on the global configuration, rather than the available lease type (e.g. monthly vs weekly).
- Fixed an issue preventing the clearing of uplift fields on the lease when the uplift information was removed via a true up modification.
- Fixed deletion control termination reversal logic to book lease income on the termination entry.
- Improved handling of uplift frequency defaulting. Previously, the default frequency was based on the first payment line; now the default frequency is based on the last payment line before the uplift date.
- Fixed an issue where all payment frequencies in a modification were being set to the same frequency rather than retaining the original frequency.

- Fixed an issue on the modification screen where adding uplift information would incorrectly trigger a "New payment schedule lines cannot be dated prior to the Effective Modification Date" alert, even though no invalid change was being made.
- Fixed an issue where, when performing a complete modification, the modification effective date would incorrectly default to the day after the period start date, rather than the day after the period end date, for pending close out leases.
- Fixed column display for fee select fields on various suitelets.
- Fixed an issue where, when performing a termination on a sales type lease, the terminated fair value of the asset would not correctly apply to the termination entry.
- Fixed an issue where, when generating a lease schedule with a missing payment and an unapplied uplift, the schedule would only be generated using the initial payment amount.
- Fixed an issue where, when performing a termination reversal for a standard termination with deletion control enabled, the reversal would not correctly reverse the termination entry, and the payment amount on the schedule line would be incorrectly set to 0.
- Fixed date filtering on adhoc fee invoice generation.
- Fixed closing sales order lines during lease automation creation via item fulfillment and directly from a sales order. By default, all sales order lines (where applicable) will be marked closed, unless manually turned off via the automation rule checkbox.
- Prevented true up modification proposals from being created if the lease is in pending close out/renewal status.
- Fixed uplift calculation for weekly payment leases.
- Fixed an issue where, when performing a close out, the transaction processing page would incorrectly display the title as "Buy Out".
- Fixed an issue where the "Close Out" button was not hidden on the lease if the global setting "Close Out Button" was disabled.
